

ALUMINUM GROUP OUTSERT® SIGNAGE CEILING MOUNT - INSTALLATION INSTRUCTION

Ceiling signs are shipped with 20 feet of heavy gage suspension wire. This wire loops through the top of the sign and is connected into the ceiling at each end. Remove the end trim plates with a small phillips screw driver. Place the wire into the slotted trough at the top of the backer assembly. Slide the wire clamping bar in the trough over the wire at each end. These wire clamping bars are held in place with two set screws for each bar that must be tightened down securely to assure the wire is clamped in place. The bars should be positioned equal distance from each end of the sign. Replace the end trim plates.

Depending on the type of ceiling, there are a variety of clamps, brackets and hooks available at any local electrical supply house for installing the wire ends into the ceiling..
